

What I like	To make it perfect
Code smells pattern language Exercises	
Sharing a common vocabulary raises the ability to think and to communicate about it	I would make sure all passports are OK
Learned about code smell languages	Explain the code first (what it does) More on mapping it to selling # days needed
Nice exercise, good discussion & answers from presenter	Give us a computer to actually apply the smells to find & do refactors (in second session?) – after initial discussion
Open discussion about need of code quality	Increase technical equipment (projector) How to (an)notate those smells in praxis
Using practical code examples to show that talking about code smells is more effective than using meaningless terms like “readability”	
Talking about code Smells as pattern language	I felt the interesting discussion about whether or not craftsmanship is optional, was cut off too quickly
Presentation style Examples to work on	List of reading material, references
Smells give you a way to discuss code quality and finding problems	
Good publicity for new book/introduction to the subject of the new book Discussion with the group clearly shows the value	
	Try to find more compelling examples, maybe not scripts I think I have one related to logging
Ruby code Investigating code	Bigger codebase, with a laptop Explain some code smells at the start, then start digging through the code
Have learned a new concept	PPT would be better

The introduction to general code smell names, the exercise, the discussions	Downplay the manager-developer example Do things a bit more interactively and use the feedback wiser
Objectivity vs “unreadable” which sounds whiny Small example but challenging	Faster tempo – more interactive – compare estimates
